

Life Cycle data sheet

Ranjan Sen

ETHL, 16-17 April 2025, Edinburgh

(1) Gorgia Toscana (Ramsammy 2017)

'GT is a variable lenition phenomenon that causes intervocalic stops to spirantise, either word internally or across word boundaries. It also applies to post-vocalic stops that are immediately followed by glide or a liquid'.

<i>Libro pericoloso</i>		'dangerous book'	
/libro#perikoloso/	→	Standard Italian	[libroperikolozo]
		Tuscan Italian	[liβroφerixolozo]
<i>La capra</i>		'the goat'	
/la#kapra/	→	Standard Italian	[lakapra]
		Tuscan Italian	[laɣaφra]

(2) Latin rhotacism (e.g. Roberts 2012)

- = morpheme boundary (given where relevant)

* = reconstructed form

~ = alternates with

		Reconstructed	Pre-classical	Classical	Translation	Notes
A	1	*sweso:r	soro:r	soro:r (later soror)	'sister'	
	2	*korpos ~ *korpos-is	corpus ~ corporis	corpus ~ corporis	'body'	nom ~ gen
	3	*ru:s ~ *ru:s-is	ru:s ~ ru:ris	ru:s ~ ru:ris	'countryside'	nom ~ gen
	4	*flo:s ~ *flo:s-is	flo:s ~ flo:ris	flo:s ~ flo:ris	'flower'	nom ~ gen
B	5	*miser	miser	miser	'wretched'	
	6	*kaisaries	caesaries	caesaries	'luxuriant hair'	
C	7	*de:-salio:		de:silio:	'I jump down'	cf. salio: 'I jump'
	8	*de:-sino:		desino:	'I desist'	cf. sino: 'I allow'
	9	*re-seko:		reseco:	'I cut back'	cf. seco: 'I cut'
	10	*ni:-si:		ni:si:	'unless'	cf. si: 'if'
D	11	*dis-emo:		dirimo:	'I take apart'	Connection to prefix <i>dis-</i> lost by classical Latin
	12	*dis-(h)abeo:		diribeo:	'I distribute'	Connection to prefix <i>dis-</i> lost by classical Latin
E	13	*kaussa	caussa	causa	'cause'	
	14	*wi:ssos	vi:ssus	vi:sus	'seen'	
F	15			basis; cisium	'pedestal'; 'cabriolet'	Loanwords borrowed in or after classical Latin
G	16	*hono:s ~ *hono:s-is	hono:s ~ hono:ris	honor ~ hono:ris	'honour'	nom ~ gen
	17	*arbo:s ~ *arbo:s-is	arbo:s ~ arbo:ris	arbor ~ arbo:ris	'tree'	nom ~ gen

Guidance questions

1. Section A: What happens to /s/ and in which environment? With the information that it does not occur across word boundaries, at which phonological level does this process appear to be occurring?
2. Section B: Does the process occur here? See the consonant following the /s/ for a potential explanation. Why might it not be an issue for A1 (see what happens to that form only later)?
3. Section C: Only forms in the later classical Latin are given. Why is the process not occurring here? At which phonological level would the process be occurring for your explanation to hold?
4. Section D: Has the process occurred here? If so, at which phonological level would it have to have occurred? Why are the forms in D different to those in C?
5. Section E: Does the process occur here? Explain the reason. Is the process still phonologically active in classical Latin? Where in the life cycle is it likely to be here?
6. Section F: Are these loanwords undergoing the process? Explain your answer.
7. Section G: How has the alternation changed between pre-classical and classical Latin? With reference to the life cycle, what has happened for this change to occur? What are the underlying representations of the two stems?

(4) Velarizing Spanish (Ramsammy 2015)

		Non-velarizing Spanish	Peninsular Velarizing Spanish (PVS)	Galician (functional vocabulary only)	
A	1	[pan]	[paŋ]		'bread'
	2	[pan-aθ-o]	[panaθo]		'bread.AUG'
	3	[pan aθimo]	[paŋ aθimo]		'unleavened bread'
	4	[kome pan]	[kome paŋ]		'eats bread'
B	5		[uŋ] ~ [una]	[uŋ] ~ [uŋa]	'a' M ~ F
	6		[alxuŋ] ~ [alxuna]	[alxuŋ] ~ [alxuŋa]	'some' M ~ F
	7		[ninguŋ] ~ [ninguna]	[ninguŋ] ~ [ninguŋa]	'no' M ~ F
	8		[de uŋ] ~ [de una]	[duŋ] ~ [duŋa]	'of a' M ~ F

Guidance questions

1. Section A: Where is /n/ realised as velar [ŋ] in Peninsular Velarizing Spanish? At which phonological level does this rule operate?
2. Section B: Compare the PVS alternations with those in Galician (functional vocabulary). Does PVS behave according to your conclusion in Section A? Does Galician behave differently? At what level is the rule operating here? Could it have progressed even further along the life cycle?

(5) Swiss German (Bermúdez-Otero 2015; Ramsammy 2015)

IPA key:

o = close-mid rounded back vowel

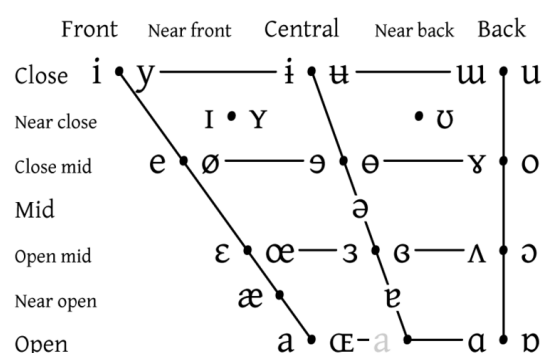

ɔ = open-mid rounded back vowel

ø = close-mid rounded front vowel

œ = open-mid rounded front vowel

N.B. In phonological terms, becoming closer = ‘raising’ and becoming more open = ‘lowering’.

VOWELS

			Translation	St Galler Rheintal	Schaff- hausen	Kesswil
A	1	/ops/	‘fruit’	[ops]	[ops]	[ops]
	2	/bokx/	‘ram’	[bokx]	[bokx]	[bokx]
	3	/holts/	‘wood’	[holts]	[holts]	[holts]
	4	/wonə/	‘live’	[wonə]	[wonə]	[wonə]
B	5	/forə/	‘Scots pine’	[fɔrə]	[fɔrə]	[fɔrə]
	6	/horn/	‘horn’	[hɔrn]	[hɔrn]	[hɔrn]
C	7	/bogə/ ~ /bogə-PL/	‘bow/bows’	[bogə] ~ [bøgə]	[bogə] ~ [bøgə]	[bogə] ~ [bøgə]
	8	/torn/ ~ /torn-PL/	‘thorn/thorns’	[tɔrn] ~ [tœrn]	[tɔrn] ~ [tœrn]	[tɔrn] ~ [tœrn]
	9	/xorb/ ~ /xorb-li/	‘basket/basket.DIM’	[xɔrb] ~ [xœrbli]	[xɔrb] ~ [xœrbli]	[xɔrb] ~ [xœrbli]
D	10	/bodə/ ~ /bodə-PL/	‘floor/floors’	[bodə] ~ [bødə]	[bɔdə] ~ [bødə]	[bɔdə] ~ [bœdə]
	11	/trottə/ ~ /trottə-li/	‘sidewalk/sidewalk.DIM’	[trottə] ~ [trøtli]	[trɔttə] ~ [trøtli]	[trɔttə] ~ [trœtli]

Guidance questions

1. Section A: Are there any phonological processes in play? Take note of the post-vocalic consonants in this section.

2. Section B: Are there any processes occurring? How might the process be described (see IPA key above)? What is the triggering environment? Give the process a name, treating the target input as specifically the one seen in the data.
3. Section C: See C7. How is the plural formed? The plural morpheme can be interpreted as a 'floating feature' (i.e. just a phonological feature, nothing else). What could this feature be based on how the plural is formed? Give the process a name.
4. See C8-9. How do the singulars/monomorphemic forms differ from C7 and is this difference expected based on your previous conclusions?
5. See C9. Why is the process you have formulated for Section C occurring here?
6. How are the derived forms in C8-9 different from C7? Is this expected based on your conclusions? Which process would need to come earlier/at a higher level in the phonology?
7. See Section D. Does St Galler Rheintal behave as expected?
8. What are Schaffhausen and Kesswil doing in the monomorphemic forms that cannot be accounted for by the processes so far? Formulate this as a separate process, taking note of the triggering environment following the vowel, and keeping the target input specific to the data.
9. What is Schaffhausen doing in the derived forms? Did you expect this? Which process is coming earlier in the phonology: the one you formulated in Section C or in D?
10. What is Kesswil doing in the derived forms? Did you expect this? Which process is coming earlier in the phonology: the one you formulated in Section C or in D?
11. Where in the phonology do your three processes occur? Hints: (a) Your Section B rule occurs within stems; (b) Your Section C rule occurs predominantly in inflected forms; (c) Your Section D rule must occur at a level above your Section C rule in the Kesswil dialect, but at the same or below in Schaffhausen.
12. Does your Section D rule look similar to your Section B one? Is it more specific or more general? Is its phonological level higher or lower?
13. Draw derivation tables showing how 'thorn/thorns' and 'floor/floors' are derived in the three dialects. Your tables should show URs at the top, SFs at the bottom, and the processes at appropriate levels (SL, WL, PL) in between.
14. Which dialect do you think is the most conservative and which is the most innovative? What makes a dialect more innovative from a life-cycle perspective?
